CC fidelity to the Li consensus sequence in their 5 or 3 regulatory region (Li= long interspersed nuclear element, LIME-1). Also included are (1) cc identifying an individual at risk for or suffering from a complex disease (CC comprises: (a) identifying or detecting the amount of intronic regions of genes containing full length Li elements or in 5 or 3 regulatory (CC regions of genes containing a full length high fidelity consensus Li (CC sequence of the individual's DNA from a sample; and (b) comparing the (CC genes or the 5 or 3 regulatory regions with a control sample of DNA (CC genes or the 5 or 3 regulatory regions with a control sample of DNA (CC suffering from a complex disease, where the genes identified are involved (CC suffering from a gent selected from an Li antisense oligonucleotide, an antibody directed against Li mRNA, and an antibody directed against Li mRNA, and an antibody directed against Li mRNA, and an antibodies or auto (CC antibodies directed against ribonucleo-protein particles having Li mRNA (CC complements, Li DNA, mRNA or protein products which indicates that the control sate of the complex disease, where the genes is a trisk for or suffering from a complex disease (CC antibodies directed against ribonucleo-protein particles having Li mRNA (CC complements, Li DNA, mRNA or protein products which indicates that the control complex disease, autoimmune disease, soft complex disease (CC altheimer's disease, autoimmune diseases, schazophrenia, systemic lupus (CC artibodies or multiple coloronic disease).
                                                                           erythematosus, multiple sclerosis, insulin-dependent diabetés mellitus, rheumatoid arthritis, phemphigus, psoriasis, autoimmune thyroid disease, scleroderma, mixed connective tissue disease, polymyositis, dermatomyositis, Sjogren's syndrome, pemphigoid, vitiligo, primary biliary cirrhosis, chronic active hepatitis, Crohn's disease, ulcerative colitis and pernicious anaemia). Detection of the protein products of L1 elements, either ORF1/P40 or ORF2 gene products can be used to indicate the presence in cells, tissue, or body fluids of potential immune system triggers that can induce or exacerbate autoimmune disease. The present sequence is a PCR primer included in the sequence listing but not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying a gene involved in a complex disease, e.g. schizophrenia, comprises detecting genes having full-length L1 element in their intronic region or high sequence fidelity to L1 consensus sequence in the 5' or 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   psoriasis; autoimmune thyroid disease; polymyositis; vitiligo; mixed connective tissue disease; dermatomyositis; Sjogren's synd pemphigoid; primary biliary cirrhosis; chronic active hepatitis; Crohn's disease; ulcerative colitis; pernicious anaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 1334
                                                                                                                                                    CC The present invention describes a method of arraying genome clones. The CC multiwell plates (a) clones of the genomic libraries contained in CC multiwell plates; (b) a primer designed based on the chromosome marker CC sequence is added to the mixture to carry out an amplification reaction; (C) a signal corresponding to the marker is detected from the resultant CC amplified product to specify the discrimination Nos. of the multiwell CC plates containing the clones having said marker sequence; (d) the order CC of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to the multiwell CC plates; (e) the clones in the multiwell plates of the specified CC discrimination Nos. are mixed respectively in each wells of longitudinal CC discrimination Nos. are mixed respectively in each wells of longitudinal CC resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell CC plates are specified from the detected result; and (i) the clones are enconstituted as the positions on the chromosome and arrayed. The CC primers for human chromosome 1936-35 DNA, and ABI45322 represent CC expresent PCR primers for human chromosome 21q22.1, which are CC specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                           Matches
                                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                               plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1936-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell the maximum in the specified discrimination Nos.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human chromosome 1p36-35 PCR primer SEQ ID NO:1374.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        multiwell plates numbered for discrimination are mixed in each of the multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABI42957 to ABI45323 represent PCR primers for human chromosome 1p36-35 DNA, and ABI45323 to ABI45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             JP2001321190-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker or sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant plates; (c) a signal corresponding to the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the crasultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals care detected from the amplified by using the clones in the multiwell plates are specified from the detected result; and (i) the clones are cultured as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent positions of the chromosome and ABL45323 to ABL45334 to PRA ABL45333 to ABL45334.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                            á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to antisense compounds and methods for compoulating the expression of human phosphorylase kinase beta. The antisense compounds, particularly antisense oligonucleotides, target and cinhibit the expression of human phosphorylase kinase beta. The antisense compounds are useful for inhibiting the expression of human phosphorylase kinase beta. The antisense compounds are useful for inhibiting the expression of human phosphorylase kinase beta in human cells or tissues and for treating an animal, comparticularly a human suspected of having or being prome to a disease or condition associated with expression of phosphorylase kinase beta such as a metabolic disorder e.g. diabetes. The compounds are useful for compartice, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. The compounds are useful in the preparation of a pharmaceutical formulation. They are highly specific, have an enhanced affinity for the nucleic acid target, and are safely and effectively administered to humans. ABK6888-ABK68965 represent human phosphorylase kinase beta compounds which comprise a phosphorothioate backbone

The invention relates to a compound 8 to 50 nucleotides in length CC targeted to a nucleic acid molecule encoding a BH3 interacting domain CC death agonist, where the compound specifically hybridises with and CC inhibits the expression of the BH3 interacting domain death agonist. The Cc compound of the invention is useful for inhibiting the expression of the CC also useful for treating an animal having a disease or condition CC associated with the BH3 interacting domain death agonist, e.g. CC haematopoietic disorder, hyperproliferative disorder, a developmental CC disorder, immunological disorder, or a disease or condition of the liver Cc., hepatitis, or a condition associated with apoptosis. The compound CC is useful for disgnostics, therapeutics, prophylaxis and as research CC easy, hepatitis, or a condition associated with apoptosis. The compound CC reagents and kits. This polymucleotide sequence represents an antisense CC oligonucleotide inhibitor of the DNA from human BH3 interacting domain CC death agonist RNA of the invention. NOTE: This sequence is a chimeric CC plosphorotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. (Updated on 29-AUG cc. 2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC determining whether the human comprises an A-allele of the ornithine decarboxylase (odc) gene, where its presence indicates a greater cc decarboxylase (odc) gene, where its presence indicates a greater cc susceptibility to epithelial cancer than one without the allele. Odc is involved in establishing cellular polyamine levels and the susceptibility cof a tissue to carcinogenesis is related to these polyamine levels. This cc an be achieved by determining the sequence of a region of the gene cc containing the single nucleotide polymorphism (SNP) or by contacting a cc polynucleotide derived from the human's genome with a first molecular cc beacon probe which is complementary to a SNP target region of the odc cg gene (e.g. at positions -3175, -3004, -1936, +263, +317, +5294, +5915, +6697, +7487 or +7886 relative to the transcription start site of the cc gene). The invention discloses a kit for assessing susceptibility of a human to an epithelial cancer which comprises the primer and coligonucleotide probes for determining the presence or absence of the A-cc allele. The method is useful in assessing the relative susceptibility of a human to an epithelial cancer, such as skin, digestive system, componed is an inhibitor or an inducer of carcinogenesis. The sequence cc presented is the forward PCR primer 1, which was used for allelic concernination of the human odc -3175 SNP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel method for detecting a polymorphism CC linked to a gene associated with familial dysautonomia (FD). Familial CC dysautonomia is an autosomal recessive disorder characterised by the CC developmental loss of neurons from the sensory and autonomic nervous CC system. The method of the invention comprises analysing human chromosome CC and detecting the presence of a polymorphism located between the CC genetic markers 19853 and 1983105 inclusive, and linked to the gene CC associated with familial dysautonomia. The invention also includes CC nucleotide sequences for detecting a polymorphism associated with CC familial dysautonomia. Using the method of the invention it was possible CC show that the gene for FD is located on human chromosome 9q31-q33. The CC method and sequences of the invention are useful for the diagnosis of CC method and sequences of the invention are useful for the diagnosis and CC disease gene, such information will facilitate prenatal diagnosis and CC help reduce the number of new cases of FD. The present sequences CC represent an oligonucleotide primer that can be used to screen for the CC 19858 genetic marker on chromosome 9, this primer was used to map the CC location of the familial dysautonomia gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                  The invention relates to a compound that is 8 - 50 nucleobases in length CC targeted to a nucleic acid molecule encoding Casein kinase 2-beta, and CC which specifically hybridises with and inhibits the expression of Casein CC kinase 2-beta, or which specifically hybridises with an 8 nucleobase CC portion of an active site on a nucleic acid molecule encoding Casein CC kinase 2-beta. Also included are: (1) a composition comprising the CC compound, and a carrier or diluent; (2) inhibiting the expression of Casein kinase 2-beta in cells or tissues by contacting the cells or CC tissues with the compound so that the expression of Casein kinase 2-beta casein kinase 2-beta an inmal having a disease or condition CC associated with Casein kinase 2-beta by administering to the animal the new compound so that the expression of Casein kinase 2-beta is inhibited. CC The antisense compounds are useful for modulating the expression of Casein kinase 2-beta and for treating diseases or conditions associated with expression of Casein kinase 2-beta, e.g. diabetes or hyperproliferative disorders, particularly cancer, such as breast cancer, or liver cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay cinfection, inflammation or tumour formation, as research reagents and compounds in distinguishing between functions of various members of a biological pathway. The present sequence is an antisense oligonucleotide of the invention targeting human casein kinase 2-beta
                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences of several protein capable of enhancing the activity of NF-kappaB. These be used in the treatment of allergy, atrophy, asthma, pollenosis, airwhypersensitivity, autoimmune diseases, graft-vs.-host diseases, endoto shock, sepsis, microbial infections, chronic hepatitis B, chronic hepatitis C, insulin-dependent or independent diabetes and many other diseases. The present sequence is a PCR primer for a coding sequence of the sequence of the primer for a coding sequence of the sequence of the present sequence is a PCR primer for a coding sequence of the sequence of the present sequence of the present sequence of the present sequence of the primer for a coding sequence of the present sequence of the presen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A new polypeptide useful in the development of agents to treat {\bf e}. autoimmune diseases and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      JP2001352986-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; NF-kappaB enhancer; allergy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a recombinant expression construct encoding a reporter gene operably linked to a promoter from a mammalian gene induced by a cyclin-dependent kinase (CDK) inhibitor. The construct is useful for identifying compounds that inhibit the induction of genes induced by CDK inhibitors. The compounds are useful for preventing or treating a disease caused by CDK inhibitor induced gene expression, e.g. cancer other than colon cancer, renal failure, Alzheimer's disease, amyloidosis, age-related diseases, atherosclerosis or arthritis. The present sequence is a PCR primer used to amplify a human promoter suitable for use in the construct of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant expression construct, useful for identifying compounds that inhibit the induction of genes induced by cyclin-dependent kinase inhibitors for preventing or treating cancer, renal failure or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                interferon-induced double stranded RNA-activated p68 kip1/eIF2 alpha protein kinase; gene therapy; infection; phosphorothioate backbone; ss.

                                                                                                                                                                                   dal, and PI/eIF2 alpha protein kinase). The compositions contain antisense compounds, particularly antisense oligonucleotides targetted t nucleic acids encoding PKR. The antisense compound is useful for inhibiting the expression of PKR and for modulating the process of RNA-mediated interference (RNAi) in a cell. It is useful for treating an animal having a disease or condition associated with PKR. It is also useful for distinguishing functions of various members of biological and kits, for distinguishing functions of various members of biological pathway, and in antisense gene therapy. It is useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence is an antisense oligonucleotide targetted to human PKR DNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antisense compound that hybridizes and inhibits nucleic ac encoding protein kinase R, useful for treating animal having dis condition associated with protein kinase R such as an autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ward DT,
                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense compounds, compositions and methods for modulating the expression of protein kinase R (also known as PKR, pRKR, interferon-induced double stranded RNA-activated p68 kinase, DAI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 15; Page 77; 61pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              alpha (ACC-alpha; see ABZ79442), which can be used for in vitro diagnosis of cancer (or of an increased risk of developing it), by detecting ACC-alpha gene mutations or polymorphisms, or altered ACC-alpha protein expression, relative to a control population. The method is particularly used to diagnose cancer, especially of breast or ovary, or for assessing the risk of developing such cancers. The present sequence is a PCR primer, which was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              In vitro diagnosis of cancer, particularly break susceptibility, comprises detecting alterations carboxylase alpha gene or protein expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; DELTA-N p73; apoptosis

```

This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nuclectide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, antiinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for diagnosing, preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome), obesity, or inflammatory

bowel syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also be used as primers and templates for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene 216 specific PCR primer used in the
                                                                                                                                                                                                                                                                                     New antisense oligonucleotide targeted to a nucleic acid encoding vascular endothelial growth factor receptor-1, useful for diagnosing treating cancer, rheumatoid arthritis, or diseases or conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vascular endothelial growth factor receptor 1; VBGF receptor; VBGFR; inhibitor; cytostatic; antirheumatic; antiarthritic; antiangiogenic; antiinflammatory; antisense gene therapy; hyperproliferative disorder; cancer; rheumatoid arthritis; angiogenesis; infection; inflammation; tumour formation; phosphorothioate; 2'-O-methoxyethyl; 2'-MOE; ss.
                             targeted to a nucleic acid molecule encoding vascular endothelial growth factor receptor-1 (VBGFR-1), where the compound inhibits the expression of VEGFR-1 and specifically hybridises with the nucleic acid encoding VEGFR-1 or with an 8-nucleobase portion of an active site on the nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human VEGFR-1 chimeric phosphorothicate oligonuclectide SEQ ID NO:98
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               04-AUG-2003

CC comprising (C) and a carrier or diluent; (2) inhibiting the expression of VEGFR-1 in cells or tissues by contacting the cells or tissues with (C) CC so that the expression of VEGFR-1 is inhibited; and (3) treating an CC administering (C) to the animal so that the expression of VEGFR-1 by CC administering (C) to the animal so that the expression of VEGFR-1 is CC inhibited. (C) has antiangiogenic, antirheumatic, antiarthritic, CC cytostatic and antiinflammatory activities, and can be used in antisense compounds are useful for modulating the CC expression of VEGFR-1 and for treating diseases or conditions associated CC with the expression of VEGFR-1, such as hyperproliferative disorders (c.e.g. cancer), rheumatoid arthritis, or diseases or conditions involving CC angiogenesis. The antisense compounds are also useful for diagnostics, CC therapeutics, prophylaxis, e.g. to prevent or delay infection, and in CC distinguishing between functions of various members of a biological CC pathway. The present sequence represents a human VEGFR-2 chimeric phosphorothicate antisense coligonucleotide, which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

to,

invention describes a compound 8-50 nucleobases in length and which specifically hybridises with a nucleic acid

associated with nucleic

acid

s, particularly antisense oligonucleotides targeted to a encoding HKR1, useful for treating a disease/condition ith HKR1, such as hyperproliferative disorder, e.g. lung.

such as hyperproliferative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC molecule encoding HRR1, and inhibits the expression of HRR1. Also composited: (1) a compound 8-50 nucleobases in length that specifically composited and at least an 8-nucleobases in length that specifically composited acid molecule encoding HRR1; (2) a composition of an active site on a cc nucleic acid molecule encoding HRR1; (2) a method for inhibiting the cc compound and a carrier or diluent; (3) a method for inhibiting the cc expression of HRR1 in cells or tissues by contacting the cells or tissues with the compound so that expression of HRR1 is inhibited, and (4) a cc method of treating an animal having a disease or condition associated with HRR1 by administering to the animal a therapeutic or prophylactic amount of the compound so that expression of HRR1 is inhibited. HRR1 can be used as the string a disease or condition and methods are useful for treating a disease or comdition and methods are useful for treating a disease or condition associated with HRR1, such as a cc hyperproliferative disorder, e.g. lung, brain or breast cancer, by diagnostics for modulating the expression of HRR1. They are also useful in research and creating the expression of HRR1. They are also useful in research and conjugations of the system of the present sequence conjugated useful in the inhibition of human HRR1 in an antisense coligonucleotide used in the inhibition of human HRR1 in an example from

The present invention describes a compound 8-50 nucleobases in length cargeted to, and which specifically hybridises with a nucleic acid compound encoding HKR1, and inhibits the expression of HKR1. Also ceasing the compound s-50 nucleobases in length that specifically compounds and a carrier or diluent; (3) a method for inhibiting the compound and a carrier or diluent; (3) a method for inhibiting the compound and a carrier or diluent; (3) a method for inhibiting the compound and a carrier or diluent; (3) a method for inhibiting the compound and a carrier or diluent; (3) a method for inhibiting the compound so that expression of HKR1 is inhibited; and (4) a compound of treating an animal having a disease or condition associated compount of the compound so that expression of HKR1 is inhibited; and (4) a compount of the compound, composition at the appeutic or prophylactic compount of the compound, composition and methods are useful for treating a disease or condition associated with HKR1 such as a compound; composition and methods are useful for the special compound of HKR1. They are also useful in research and composition for modulating the expression of HKR1. They are also useful in research and composition be used as human HKR1 chimeric phosphorothicate of present sequence conjugonucleotide used in the inhibition of human HKR1 in an example from the present sequence conjugonucleotide used in the inhibition of human HKR1 in an example from the present is an antisense conjugonucleotide used in the inhibition of human HKR1 in an example from the present is an antisense conjugonucleotide with the inhibition of human HKR1 in an example from the present is an antisense conjugonucleotide with the inhibition of human HKR1 in an example from the present is an antisense conjugonucleotide with the inhibition of human HKR1 in an example from the present is an antisense conjugonucleotide with the present is an antisense conjugonucleotide with the present is an antisense conjugonucleotide with the present is an antisense co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compounds, particularly antisense oligonuclectides targeted to nucleic acid encoding HKR1, useful for treating a disease/condition associated with HKR1, such as hyperproliferative disorder, e.g. lum

                                                                                                                                                                                                       crangeted to a nucleic acid molecule encoding BCL2-associated X (BAX)

composed protein, where the compound specifically hybridises with the nucleic acid molecule encoding BAX protein and inhibits the expression of BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition comprising (I) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (I); and (3) treating an animal having a disease or condition associated with BAX protein is inhibited. (I) has nootropic, neuroprotective, antiparkinsonian, anticonvulsant, ophthalmological, antidiabetic and colinarist The antisense compounds (I) are useful for modulating the expression of BAX protein, and for treating a disease or condition associated with BAX protein, e.g. familial amylotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease, Hodgkin's disease, cartilage-hair hyperplasia, diabetes-associated ocular disorders or contition or a condition that arrises from abarrant approach.

        The present invention describes a compound (I) 8-50 nucleobases in length (I targeted to a nucleic acid molecule encoding BCL2-associated X (BAX) (I protein, where the compound specifically hybridises with the nucleic acid molecule encoding BAX protein and inhibits the expression of BAX protein. The compound specifically hybridises with at least 8-nucleobase portion (I a nactive site on a nucleic acid molecule encoding BAX protein. Also (I a composition comprising (I) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising contacting the expression of BAX protein in cells or tissues comprising analimal having a disease or condition associated with BAX (I reating an animal having a disease or condition associated with BAX (I protein comprising administering to the animal (I) so that expression of BAX protein is inhibited. (I) has nootropic, neuroprotective, antiparkinsonian, anticonvulsant, ophthalmological, antidiabetic and contributes, and can be used in antisense therapy, and as a BAX antigenist. The antisense compounds (I) are useful for modulating the
                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADA20924 standard;
                                                                                                                                                                                                                                                                                                                  New antisense compounds, useful for modulating the expression of BCL2-associated X (BAX) protein or for treating a disease or condition associated with BAX protein, e.g. Parkinson's disease, Hodgkin's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Parkinson's disease; Hodgkin's disease; cartilage-hair hyperplasia; diabetes-associated ocular disorder; scrapie infection; aberrant apoptosis; human; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human BAX chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADA20924;
                                                                                                                                                                                                                                                                                                        or Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cartilage-hair hyperplasia, diabetes-associated ocular disorders or scrapie infection, or a condition that arises from aberrant apoptosis. The compounds are useful as research reagents and in diagnostics. The present sequence represents a human BAX Chimeric phosphorothicate oligonucleotide, which is used in an example from the present inventic
                             This invention relates to a novel isolated human gene DYXC1 that is functionally related to dyslexia, more particularly it describes single nucleotide polymorphisms thought to predispose an individual in to developing dyslexia. This is a neurological disorder with a genetic basis (DYXC1 has been isolated to chromosome 15q21), which manifests itself as a specific reading disability. Specifically, DYXC1 is can be useful in study of brain processes such as reading, phonological processing, rapid naming and verbal short-term memory. Accordingly, the present invention describes methods and materials for analysing allelic variations in the DYXC1 gene, and also provides DYXC1 as an antigen for the production of antibodies used in the diagnosis of dyslexia. This oligonuclectide is the EKN1-9R PCR primer that is specific for human intronic DYXC1, and is used to amplify exon 9 in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 associated with BAX protein, e.g. familial amylotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease, Hodgkin's disease,

                                                                                                                                                      The invention relates to an oligonucleotide primer capable of specifically hybridising to a DNA having the sequence of the flanking regions of a microsatellite selected from M2-4-9, M2-2-12, M2-2-12, M2-2-21, M2-2-22, M2-2-23, M2-2-24, M2-2-24, M2-2-25, M2-4-36, M2-2-26, M2-2-36, M2-4-31, M2-3-22, M2-2-36, M2-5-11, M2-2-29, M2-2-32, M2-4-32, M2-4-33, M2-4-37, M2-3-22, M2-2-36, M2-5-11, M2-2-46, and M2-2-48. The primer is useful for determining the number of repeat units of the microsatellite cited above. The primer is useful in HIA-related research, such as genetic mapping of HIA class II-associated diseases, transplantation matching, population genetics, and identification of recombination hot spots as well as linkage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADA27318

                                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel antisense compounds that modulate the capression of oestrogen receptor beta (ERSB). Oestrogen is a steroid commone that exerts a wide range of effects throughout the human body being primarily involved in female sexual maturation. Additionally, component that exerts a wide reproductive tissues, is known to be convery oestrogen targets male reproductive tissues, is known to be converted to bone maintenance and plays a protective role in the coardiovascular system. This hormone receptor, ERSB (also known as ER coardiovascular system. This hormone receptor, ERSB (also known as ER coardiovascular system. This hormone receptor, ERSB (also known as ER coardiovascular system. This maturation cells indicating an involvement in coasse, uterine leiomyomata and neoplasms of the kidney. Furthermore, coardingly, the selective inhibition of ERSB by coardingly, the selective inhibition of ERSB by coardingly, the selective inhibition of ERSB by coardingly captured to the sinvention could provide a therapeutic target for the treatment of cancer, as well as other ERSB-coardingly selective inhibition of ERSB by coardingly selective inhibition of ERSB by coardingly selective sequence is the chimeric human captured to antisense oligo used to inhibit expression of human ERSB, the aim of the cinvention. Note that it has two terminal five nucleotide 2-methoxyethyl coardingly separated by a ten deoxynucleotide gap. The coligonucleotide backbone is phosphorothioate throughout
                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the expression of human eukaryotic translation initiation factor 2C 1 (EIF2C1). EIF2C1 is located on chromosome 1934-35, and is also known as Co-eIF2C, eIF2C, Golgi ER protein 95kDa, GERp95 and Q99. It is an intracellular membrane associated protein thought to be involved in cellular differentiation, such that altered expression of EIF2C1 can affect cell growth, morphology and tumourigenicity. Accordingly, antisense oligonucleotides that inhibit the expression of EIF2C1 in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders, familial hypercholesterolaemia and cancer, as well as polycystic kidney disease, cystic fibrosis and progeriod syndrome. As such, the oligos of the present invention can be described as having cytostatic and antisense oligo used to inhibit expression of the human eukaryotic translation initiation factor 2C 1 (EIF2C1) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antisense; ss; human; eukaryotic translation initiation factor 2C EIF2CI; Co-eIF2C; eIF2C; Golgi ER protein 95kDa; GERp95; Q99; gene therapy; hyperproliferative disorder; familial hypercholesterolaemia; cancer; polycystic kidney disease; cystic fibrosis; progeriod syndrome; cytostatic; antilipaemic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating hypercholesterolemia or hyperproliferative disorder, e.g.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20

                                                                                                                                                                                                                                                                                                                   This invention relates to novel antisense oligonucleotides that modulate CC the expression of human eukaryotic translation initiation factor 2C 1 (EIF2CI). EIF2C1 is located on chromosome 1p34-35, and is also known as CC co-eIF2C, eIF2C, Golgi ER protein 95kDa, GERp95 and Q99. It is an CC cintracellular membrane associated protein thought to be involved in CC cellular differentiation, such that altered expression of EIF2C1 can CC affect cell growth, morphology and tumourigenicity. Accordingly, CC antisense oligonucleotides that inhibit the expression of EIF2C1 in cells CC rissues can be used in gene therapy to treat various conditions CC including hyperproliferative disorders, familial hypercholeserolaemia CC and cancer, as well as polycystic kidney disease, cystic fibrosis and CC progeriod syndrome. As such, the oligos of the present invention can be CC described as having cytostatic and antilipaemic activities. This CC of the human eukaryotic translation initiation factor 2C 1 (EIF2C1) DNA
                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises the amino acid and coding sequences of human proteins (PGSF1a, PGSF1b, PGSF2 and Pi-a) that are specifically expressed in the human pituitary. The DNA and protein sequences of the invention are useful for the diagnosis and treatment of pituitary disease (e.g. autoimmune pituitary inflammation) and joint diseases (e.g. rheumatoid arthritis). The present DNA sequence was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

The COREST antisense oligonucleotide has any of 72 specifically claimed sequences of 20 bp, given in the specification. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of COREST, such as a developmental disorder and/or a hyperproliferative condition like neuronal cancer. The current sequence represents an antisense oligonucleotide for the inhibition of human COREST MENNA levels. Nucleotides of the invention have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modified_base

The COREST antisense oligonucleotide has any of 72 specifically claimed sequences of 20 bp, given in the specification. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of COREST, such as a developmental disorder and/or a hyperproliferative condition like neuronal cancer. The current sequence represents an antisense oligonucleotide for the inhibition of human COREST mRNA levels. Nucleotides of the invention have
                       antisense oligonucleotide; human; mdm2; hyperproliferation; hyperproliferative disorder; cancer; psoriasis; fibrosis; atherosclerosis; restenosis; apoptosis modulation; p21; ss; 2'-methoxyethoxy-residue; phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotide compounds, useful for the diagnosis, prevention and/or treatment of conditions with aberrant expression or activity of COREST, such as developmental and/or hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modified_base

The antisense oligonuclectides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonuclectides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonuclectides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonuclectide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting

The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2 useful for treating e.g. cancer, psoriasis or restenosis by inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 9; SEQ ID NO 265; 289pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a

                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                cytostatic, neuroprotective, mostropic, antiarteriosclerotic, antiarthritic and nephrotropic activities and may be useful in identifying compounds that inhibit the induction of genes involved in viral infection, cancer, renal diseases or age-related diseases including Alzheimer's disease, atherosclerosis or arthritis, such genes being induced by cyclin-dependent kinase inhibitors. Furthermore, The constructions have gene therapy applications. The current sequence is that of the PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant expression construct for identifying and modulating expression of genes regulated by cyclin-dependent kinase inhibitors, as genes involved in viral infection, cancer, renal diseases or age-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                virucide; cytostatic; neuroprotective; nootropic; antiarteriosclerotic;

                                                                                                                                                                         The invention relates to a novel pharmaceutical composition, which has a clive agent comprising an oligonuclectide antisense to the clinitiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of cC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention chas antiinflammatory, antiallergic, antiasthmatic, hypotensive, acc use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also confort in a subject or the appearance of an ininflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or clung surfactant in a subject s tissue, or treating bronchoconstriction, lung surfactant in a subject s tissue, or treating bronchoconstriction, contest of the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at few wins int/min/inhi/inhi/indirectors.

A composition of the invention thas antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cimmunosuppressive, and cytostatic activity. The composition may have a cimmunosuppressive, and cytostatic activity. The composition may have a cimmunosuppressive, and cytostatic activity. The composition may have a consisting a respiratory, lung or malignant disease or condition, also consider the prophylactic or therapeutic respiratory effect of an continflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodollation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, constitution, inflammation, lung allergies, or a respiratory disease or condition. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel pharmaceutical composition, which has if the first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or corresponding control of steroid or corresponding control or correspondin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;

                                                                                                                                                                                                        initiation codon, coding region, 5 or 3 end genomic flanking regions, coding region, 5 or 3 end genomic flanking regions, coding region, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal alivary dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a matisense gene therapy. The composition is useful for treating or greventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or dapleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction. Construction, lung allergies, or a respiratory disease or condition. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;

                                                                                                                              Matches
                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                             use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                           CC first active agent comprising an oligonucleotide antisense to the comprising and oligonucleotide and uncleotides of comprising and oligonucleotide associated with lung and/or comparison and a second active associated with lung and/or comparison and a second active associated with lung and/or comparison antisinflammatory steroid and ubiquinone A composition of the invention comparison antisense gene therapy. The composition is useful for treating or compressive, and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition may have a compressive of a respiratory, lung or malignant disease or condition, also composition as the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or composition in a subject tissue, or treating bronchoconstriction.

CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC Note: The sequence data for this patent is not represented in the printed as pecification, but was obtained in electronic format directly from WIPO as formation.

A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cycostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of indenosine or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or corresponding controls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;

                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation codon, coding a polypeptide associated with lung and/or intronexon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC inseal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC inmunosuppressive, and cytostatic activity. The composition may have a CC in antisense gene therapy. The composition is useful for treating or greventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antisense gene therapy. The adenosine, reducing levels of adenosine CC for reducing sensitivity to adenosine, reducing levels of adenosine content in a subject, for respiratory of bulguinone or constraint in a subject, for respiratory or depleting levels of subjection as subject, a prophetical services of the prophylactic or theraps of the prophylactic or sensition, increasing levels of bulguinone or constraint in a subject, for reducing levels of bulguinone or constraint in a subject, for reducing levels of bulguinone or constraint in a subject, for reducing levels of bulguinone or constraint in a subject of the prophylactic or the 
                                                                                                                      Matches
                                                                                                                                                                                                                                            Sequence 20
                                                                                                                                                                                                                                                                                            lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             corresponding RNAs,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

5' and 3' intron-exem junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of beginning or the composition of the prophylactic continuous control of the subject.
                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5, or 3, end genomic flanking regions, or regions within 2-10 nucleotides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABZ97264 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; antisense; lung dysfunction; nasal airway dysfunction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABZ97264;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABZ97912
                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in annisense gene therapy. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic regiratory effect of an antisflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine ceceptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or at ferming in format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiaschmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or

                                                                                                                                                                                                                                                 The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antianflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or constraints.

                                                                                                                                                                                                                                           junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, have a immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel pharmaceutical composition, which I first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking region, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;

                                                                                                                                                                                                       CC first active agent comprising an oligonucleotide antisense to the contribution codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, CC use in antisense gene therapy. The composition is useful for treating or CC reventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of of reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or at ferm when in the printed in the printed of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                             CC junctions of genes encoding a polypeptide associated with lung and/or cc antiinflammatory steroid and ubiquinone. A composition of the invention cc antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a crown antisense gene therapy. The composition is useful for treating or cc use in antisense gene therapy. The composition is useful for treating or cc reventing a respiratory, lung or malignant disease or condition, also composition a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine cf. or reducing sensitivity to adenosine, reducing levels of adenosine conformation, lung surfactant in a subject's tissue, or treating bronchoconstriction, cc lung surfactant in a subject's tissue, or respiratory disease or condition. Cc lung inflammation, lung allergies, or a respiratory disease or condition. Cc lung inflammation, but was obtained in electronic format directly from WIPO case for the printed and the printed control of the printed and the printed and the printed are the printed and the printed and the printed are the printed and the printed and the printed are the printed and the printed and the printed are the printed and the printed are the printed and the printed are the printed and the printed and the printed and the printed and the printed are the printed and the

A composition of the invention comparison antisinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition also occurs in antisense gene therapy. The composition is useful for treating or compressive, are prophylactic or therapeutic respiratory effect of an composition of the prophylactic or therapeutic respiratory effect of an composition sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or composition and prophylactic tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, content of the prophylactic this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or the prophylaction of the printed are the prophylaction of the printed and the printed and the prophylactic patent is not represented in the printed confidence in the printed and the printed are the prophylaction of the printed and the printed and

                                                                                                                                                                                                 The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC infinitelammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC or enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine CC receptor, producing bronchodilation, increasing levels of bully inflammation, lung allergies, or a respiratory disease or condition. CC lung surfactant in a subject's tissue, or treating bronchoconstriction, control inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO at free wine inflammation inflammation inflammation inflammation in the printed in the printed in the printed in the printed at the printed in the printed in the printed at the printed in the printed at the printed in the printed in the printed at the printed in the printed in the printed at the printed in the printed in the printed at the printed in the printed in the printed in the printed at the printed in the printed in the printed at the printed in the printed in the printed at the printed in the printed in the printed in the printed at the printed in the printed at the printed in the
